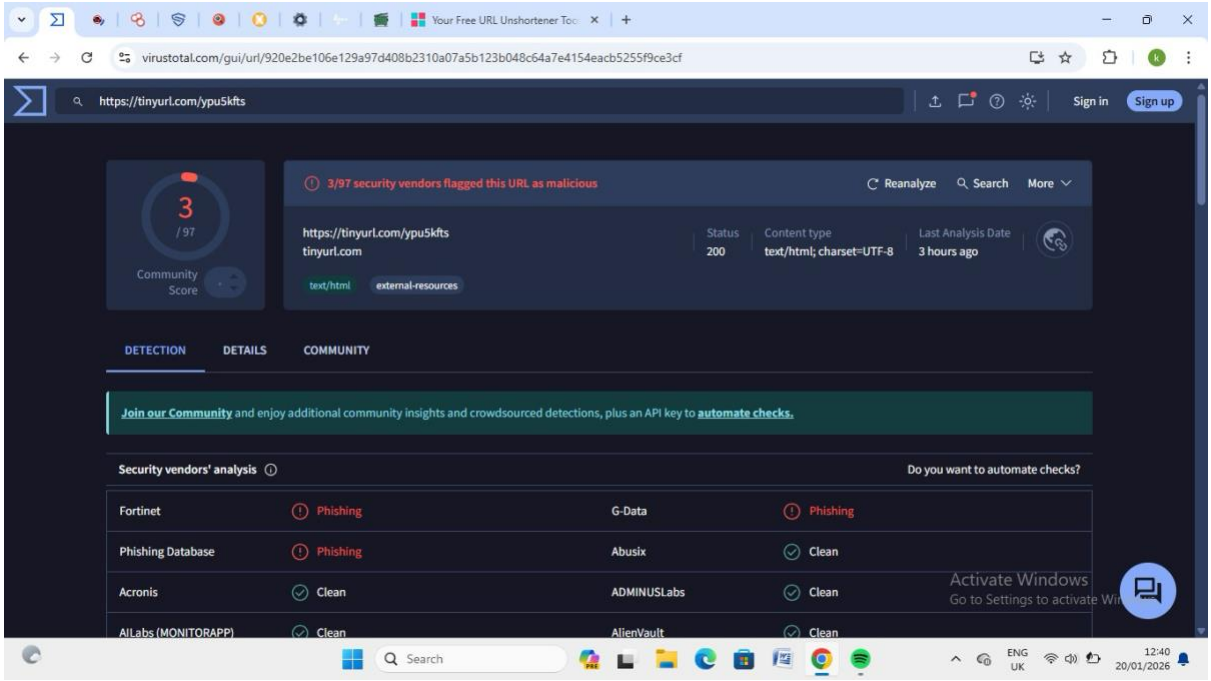
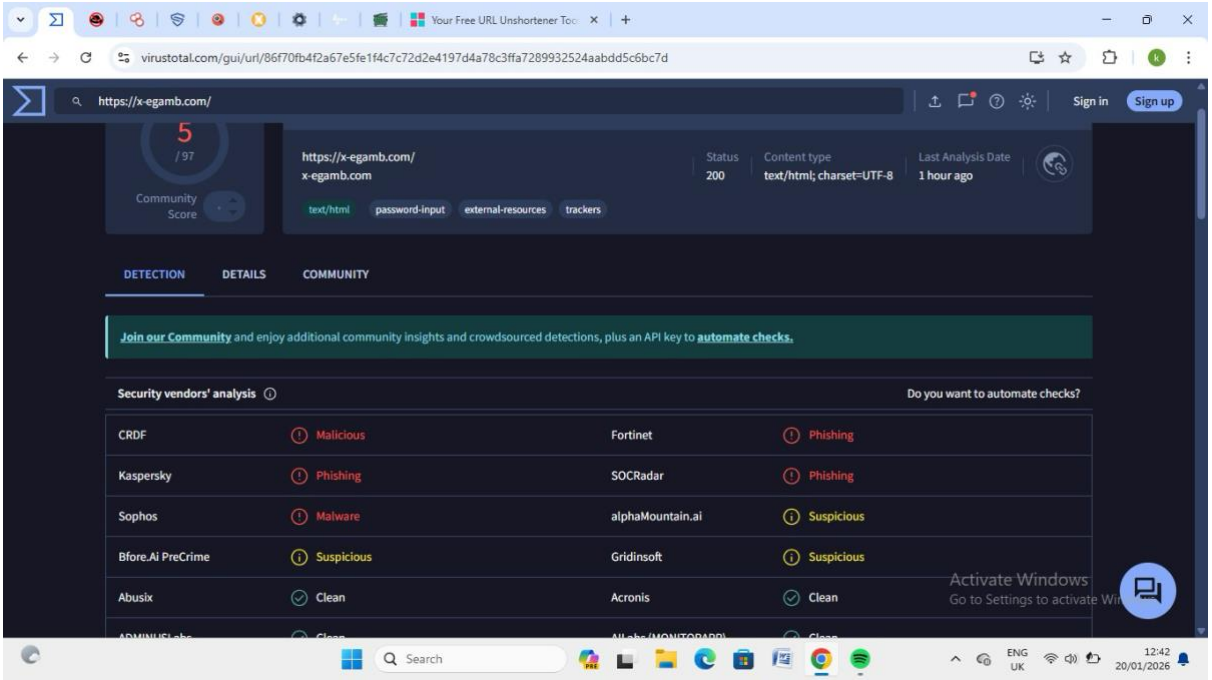
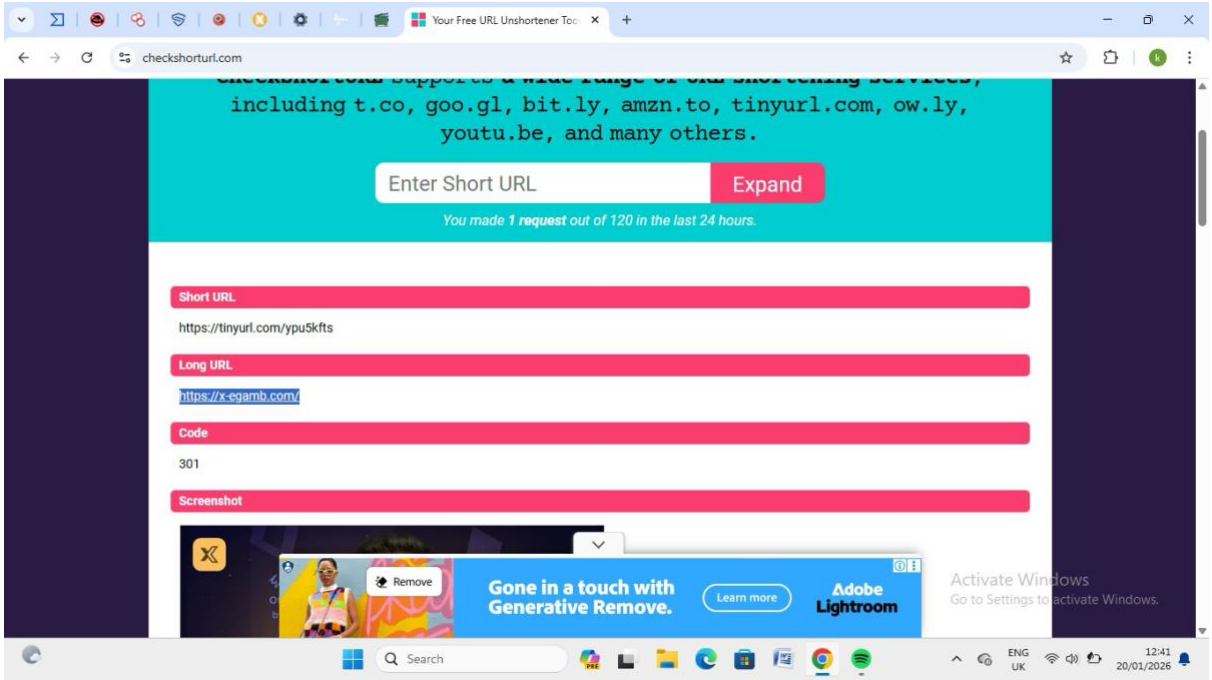
1. **Identify all indicator or compromise (IOCs) present in the email**



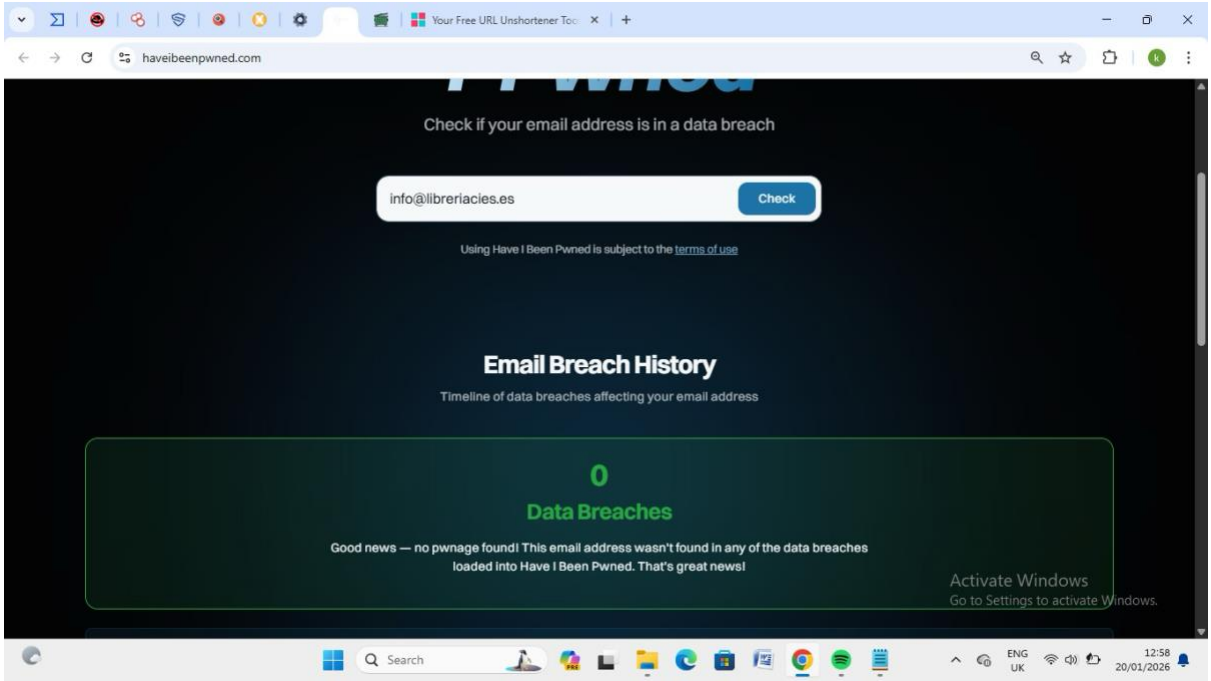


- The first image is the Shortened link, as in the original link on the mail and 3 vendors flagged it as a phishing link which is suspicious.
- The second image is the unshortened link, like the original link not the one on the mail, this shows that 5 vendors flagged it phishing link and 3 vendors flagged it suspicious.

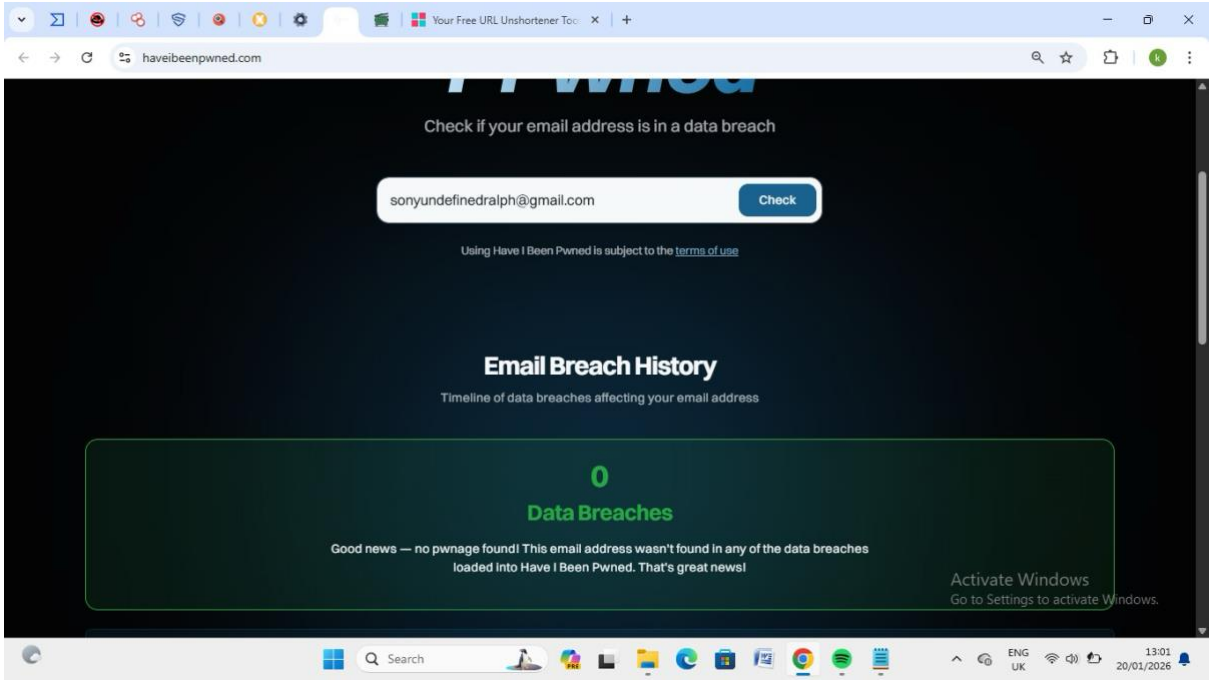


- This is the page that shows that I reveal the hidden link

2. Investigate the email and state your findings.

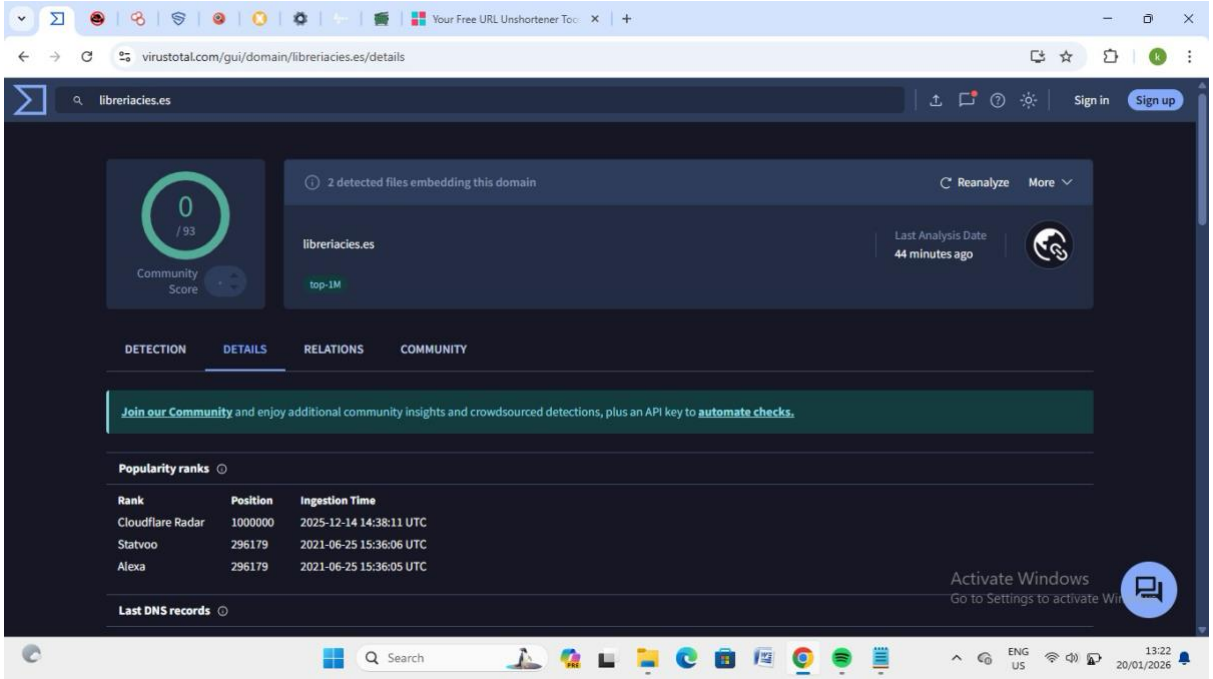


- This is where I investigated the email address of the sender and it show the email address have not been found on dark web or the email address have been breached.



- This is where I investigated the receivers mail, the mail has no data breaches also.

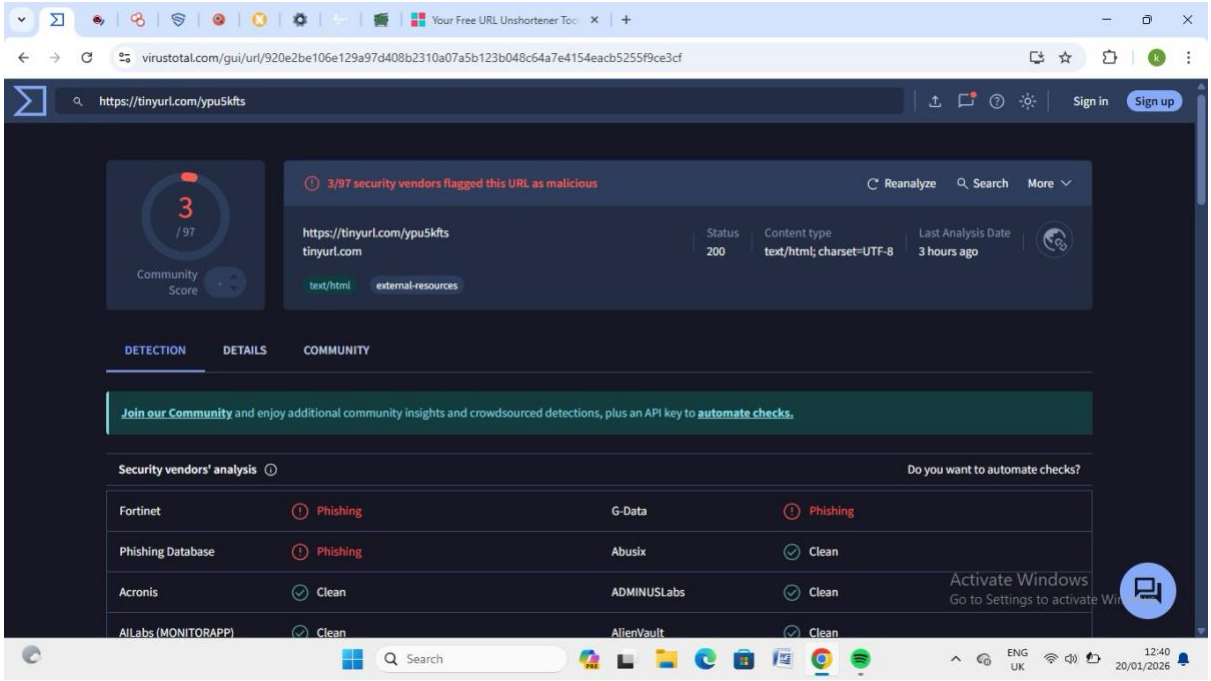
3. **Analyze the sender's domain and comment its reputation and configuration.**



- the senders domain ip is 217.18.163.139, the ip address location is Granada Spain, moreover the senders mail domain is a clean domain with no bad record.

4. **Analyze the embedded URL safely (do not click the link) and determine whether is malicious or suspicious.**

- After my analysis on the embedded URL, this is a malicious mail, cause if it's not that is malicious, why embed the url ?



5. **Based on your findings determine whether this email is a phishing incident and justify your answer**

- This is a phishing incident
- The structure of the email is so fishy cause why give me deadline on when to verify my account ?
- Since the message is from Microsoft IT team, why is the senders email not related to them at all?
- Why will Microsoft team embed their link ?
- After my analysis the vendors flagged it phishing and the mail has a phishing structure also.
- The main link (unshortened link) is also flagged as phishing also, to my opinion I think after they saw that their normal link has been flagged then they shortened it to look more attractive.
